**AN INNOVATIVE AND TOTALLY NEW
CONCEPT OF CLEANING HOLDING
TANKS WITH HIGH PRESSURE WATER**

**REMOVES SLUDGE AND
ODOR-CAUSING ELEMENTS FROM
THE INTERIOR OF HOLDING TANKS
WITH 1500 PSI WATER PRESSURE**

CHEMICAL-FREE

**CHEMICALS CREATE A SLUDGE
OR THICK, PANCAKE-LIKE BATTER
IN YOUR BLACK TANK AND MAKE IT
HARDER TO GET WASTE OUT**

**IN OTHER WORDS, THESE CHEMICALS
MAKE A BIG "MESS" IN YOUR TANKS**

**WATER FLOW IS FRICTION
AND FRICTION IS WHAT
CLEANS TANKS AND SENSORS**

**MORE WATER IN AND OUT
OF THE TANK IS THE BEST
ALL-NATURAL CLEANING AGENT**

MOBILE SERVICE

**WE COME TO YOU
AND SERVICE YOUR RV ON-SITE!**

WHO ARE WE?

We're Jim and Debbie Tome from Sycamore, Illinois, though now roaming throughout the United States to experience all the wonders of our great country. We're RVers just like you and love to meet and talk to new people.

About a year ago, we had problems with our RV tanks: the sensors weren't reading correctly, there was a nasty odor and sometimes the grey water even backed up into our RV. YUCK!

But we met Preston Brown, the inventor of the All Pro Water Flow process, and had our RV's holding tanks professionally cleaned. Boy were we amazed at what had been building up for years and years!

Preston took the time to tell us how waste can build up over time, affecting the sensors and causing other problems. He explained how important it is to keep the tanks filled with liquid, how often to flush them and even how chemicals can cause tanks to gum up and become clogged. One tank cleaning procedure and we were sold!

Now, we've become All Pro Water Flow dealers ourselves and hope to educate other RVers on proper holding tank maintenance and care. We can't emphasize that last point enough — even though you may not think you have problems now, it's important to have your holding tanks professionally flushed and cleaned once a year.

Give us a call and we'll explain more and give you a FREE estimate on cleaning your black and grey holding tanks as well as your water heater tank. Thanks and see you around!

YOU'VE GOT QUESTIONS? WE'VE GOT THE ANSWERS!

What is causing odor problems in my black and grey tanks?

Odor problems are usually caused by leftover waste that is still in the tanks after flushing. Get rid of the sludge and you get rid of the odor. The use of chemicals only masks the problem and does not fix it.

What is causing misreading problems on my waste tank probes or sensors?

Misreading problems on waste tanks can be caused by two things: Unclean tanks with sludge, paper or calcium build-up on the sensors, or electrical problems with the sensors and control panel. In most cases, sensor problems are usually caused by dirty tanks.

If I purchased a pre-owned RV, did I get somebody else's "foreign matter?"

Yes, because cleaning attachments and chemicals are not powerful enough to remove all foreign matter. Most RV dealers reselling an RV will simply fill the tanks full of chemicals and dump them a couple of times.

Is a tank replacement necessary if there is an odor or misreading sensor?

Very, very rarely. These types of problems are usually caused by unclean tanks. A thorough Hydro-Cleaning of your waste tanks will almost always solve these problems.

Do cleaning attachments that a RV owner can buy really work? What PSI pressure are they operating at?

In many cases, these attachments will help some, but only if there is a minimal build up of waste matter in your tanks. Most of these consumer-type attachments, however, screw onto a common garden hose and operate at only 40 to 50 PSI, not the 1500 PSI that our specialized equipment works at.

How often should I give holding tanks a thorough Hydro-Cleaning?

We recommend that your RV have a professional Hydro-Cleaning at least once a year to keep foreign waste and other matter from building up. It's also a good idea to have your tanks professionally flushed just before winterizing.

How long does the process take and do I need to leave my RV?

The Hydro-Cleaning process is scheduled by appointment and completed in about one hour, while you wait. There is no need to leave your RV, though we do request you on-site.

How do I know if all of the waste and foreign matter is out of my tanks?

We welcome you to watch the process. You'll see what we are flushing out through the clear pipe connector we attach to your RV and you'll see when the water turns clean and clear.

HOLDING TANK MAINTENANCE

You can do your part to maintain the function of your RV's holding tanks. Just follow these helpful tips:

Before You Leave for a Trip

Fill your grey and black water holding tanks about 1/3rd full of fresh water. The sloshing motion of your moving RV combined with the water in the tanks will help break down solids and gently clean the tanks.

During Your Trip or As You're Using Your RV

Keep both the grey and black tank valves closed, even if a dump is available. Your tanks sensor panel should read 2/3rds FULL to FULL before dumping. If they don't and you need to dump, top off both tanks with fresh water for an accelerated exit flow.

When you leave the RV park, resort or campground, dump the tanks and fill each one 1/3rd full with fresh water for your trip home or to your next destination.

After Your Trip

Top off both tanks with fresh water and dump before storing. Be sure to winterize (if applicable) and add a lubricating antifreeze to tanks before storing long-term.

Want a Low-Cost, Tank-Safe Deodorizer?

In our opinion, there is not one chemical that is currently on the market that truly cleans the tanks and the sensors as they all advertise. Every black tank chemical company claims that their product breaks down or liquifies waste.

Indeed, that is exactly what they do. They create a sludge or thick pancake-like batter in the black tank and make it harder to keep tanks completely clean. In other words, these chemicals make a big "mess" in your tanks. Try this instead:

Mix 40 ounces of Pine-Sol with enough water to just about fill a gallon jug. Top off with a half cup of Calgon Bath Beads. Use eight ounces in each tank (or more in especially hot weather or if your tanks will be filling up slowly over time).
